

Validate every change. Catch regressions early.

ENIT Test Framework makes you aware of every change — **validate document and data integrity with ease and confidence**. Run one test or all at once, compare outputs automatically, and turn results into actionable insights.

— THE BUSINESS VALUE

- 01 **Automate repetitive tests** — Automate complex testing with minimal manual effort. Faster and more consistent execution, release after release.
- 02 **One-click and bulk execution** — Run a single test or execute all at once. API tests with API keys, OAuth, and basic auth — validate internal and external business-critical services.
- 03 **File and PDF comparison** — Validate outputs automatically through file and PDF comparison. Compare what matters, ignore the rest.
- 04 **Actionable test insights** — Clear dashboard of results. Detailed history for audits and compliance. Execution-time tracking identifies performance bottlenecks before they hurt.
- 05 **Secure and anywhere** — API credentials stored encrypted. Full traceability. Integrates on-premise and in the cloud — works fully in isolated or regulated environments.

— WHO BENEFITS MOST?

Built for CCM, integration, and API teams who need continuous validation — in development, QA, and production — across regulated, isolated, or cloud-hybrid environments. Common in financial services, energy and telecom, public sector, and manufacturing.

— BUILT BY ENIT

CCM specialists with +10 years of Nordic implementations — across OpenText, Quadiant, and SMART Communications environments.

Unlike vendor-native tools, ENIT products works across platforms and ERPs from day one, because our customers rarely run just one system.
